AMENDMENTS TO THE CLAIMS

Please amend claims 1, 3, 5, 7, 15, 16, 17, 22, 32, 39, 40, 42 - 44 and cancel claims 2, 41 as noted below:

1. (Currently amended) A method for downloading resources, each having a size, from a source to an intermediate storage facility, having a finite storage capacity, the method comprising:

determining a probability of using a resource, the probability in part determined via;

{a)} accepting at least one user-based factor;

{b)} accepting at least one resource-based factor; and

{c)} ~~[pro-actively]~~ maximizing an expected value of downloaded resources *via* utilization of the at least one user-based factor and the at least one resource-based factor.

2. (Cancelled)

3. (Currently amended) The method of claim {2} 1 further comprising determining [the] probabilities that a user belongs to various user type classes.

4. (Original) The method of claim 3 wherein the probabilities that a user belongs to various user type classes are determined based on evidence using a Bayesian network.

5. (Currently amended) The method of claim {2} 3 wherein the at least one resource-based factor includes probabilities that users of the various user type classes will use the resource at least once.

6. (Previously presented) The method of claim 1 wherein the at least one resource-based factor includes probabilities that users of various user type classes will use the resource at least once.

09/820,519

MS91212.01/MSFTP291US

7. (Currently amended) The method of claim ~~{2}~~ 3 wherein the at least one resource-based factor is a probability that the resource will be used at least once and is based on a sum, over all user type classes, of a product of (a) a probability that the resource is used at least once, given that an application to which the resource belongs is used at least once, by a user of the user type class, a probability that the application to which the resource belongs is used at least once by a user of the user type class, and (c) a probability that the user belongs to the user type class.

8. (Original) The method of claim 1 wherein the at least one resource-based factor includes an association of each of the resources to at least one application class.

9. (Original) The method of claim 8 wherein the at least one resource-based factor includes an indication, for each of the resources, of whether the resource is a core component or an optional component of the application class with which it is associated.

10. (Original) The method of claim 1 wherein the act of maximizing an expected value of downloaded resources includes maximizing an expected value density of downloaded resources.

11. (Original) The method of claim 1 wherein the act of maximizing an expected value of downloaded resources includes minimizing an expected cost of not having a needed resource.

12. (Original) The method of claim 11 wherein the expected cost of not having a needed resource is based on one of enhancement rates of the resources and value densities of the resources.

13. (Original) The method of claim 12 wherein the enhancement rate of a resource is based on the size of the resource, a probability of that resource being used at least once, and a cost of later downloading the resource.

09/820,519

MS91212.01/MSFTP291US

14. (Original) The method of claim 12 wherein the value density of a resource is based on the size of the resource and the probability that the resource will be used at least once.

15. (Currently amended) An apparatus for downloading resources, each having a size, from a source to an intermediate storage facility, having a finite storage capacity, the apparatus comprising:

{a)} a storage device for storing at least one user-based factor and at least one resource-based factor; ~~and~~

{b)} means for ~~proactively~~ maximizing an expected value of downloaded resources *via* utilization of the user-based factor and the resource-based factor; and means for intelligently downloading a resource based on a probability of use.

16. (Currently amended) A storage medium having machine executable instructions which, when executed by a machine, effect acts of:

{a)} accepting at least one user-based factor;
determining a probability of use for a resource by a user in a user type class;

{b)} accepting at least one resource-based factor; and

{c)} ~~proactively~~ maximizing an expected value of downloaded resources *via* utilization of the at least one user-based factor and the at least one resource-based factor.

17. (Currently amended) A method for installing software components, each having a size, from a source to an intermediate storage facility, having a finite storage capacity, the method comprising:

predicting an expected frequency of use for a software component, in part *via*:

{a)} accepting at least one user-based factor;

{b)} accepting at least one component-based factor; and

09/820,519

MS91212.01/MSFTP291US

{e}} [proactively] maximizing an expected value of downloaded software components *via* utilization of the at least one user-based factor and the at least one component-based factor.

18. (Original) The method of claim 17 wherein the at least one user-based factor includes probabilities that a user is member of various user type classes.

19. (Original) The method of claim 17 wherein the at least one component-based factor includes an association of each of the software components to one of a plurality of application classes.

20. (Original) The method of claim 19 wherein the at least one component-based factor further includes an indication, for each of the software components, of whether the software component is a core component or an optional component of the application class with which it is associated.

21. (Original) The method of claim 20 wherein the at least one component-based factor further includes probabilities that each of the software components will be used at least once by users of various user type classes.

22. (Currently amended) A method for distributing resources, each having a size, among at least two storage facilities, each of the storage facilities having a finite capacity and a request-to-receive latency, the method:

{a}} accepting at least one user-based factor;

{b}} accepting at least one resource-based factor;

{c}} accepting at least one storage facility-based factor; {and}

accepting probabilistic relationships between user based factors and resource based factors; and

{d}} minimizing total expected latencies to request and receive resources *via* utilization of the user-based factor, the resource-based factor, and the storage facility-based factor.

09/820,519

MS91212.01/MSFTP291US

23. (Original) The method of claim 22 wherein the at least one user-based factor includes probabilities that a user belongs to various user type classes.
24. (Original) The method of claim 23 further comprising determining the probabilities that a user belongs to various user type classes.
25. (Original) The method of claim 24 wherein the probabilities that a user belongs to various user type classes are determined based on evidence using a Bayesian network.
26. (Previously presented) The method of claim 23 wherein the at least one resource-based factor includes frequencies at which users of the various user type classes will use each of the resources.
27. (Original) The method of claim 26 wherein the at least one storage facility-based factor includes an available capacity of each of the two storage facilities and a relative request-to-receive latency of each of the two storage facilities.
28. (Original) The method of claim 27 wherein the total expected latencies is a function of the frequencies at which users of the various user type classes will use each of the resources, and a difference between the relative request-to-receive latencies of the two storage facilities.
29. (Original) The method of claim 22 wherein the at least one storage facility-based factor includes an available capacity of each of the two storage facilities and a relative request-to-receive latency of each of the two storage facilities.
30. (Original) The method of claim 22 wherein the total expected latencies to request and receive resources is minimized based on value densities of the resources.

09/820,519

MS91212.01/MSFTP291US

31. (Previously presented) The method of claim 30 wherein the value densities of the resources are based on the frequency of use of the resources and a difference in request to receive latencies between the at least two storage facilities.

32. (Currently amended) A method for distributing resources, each having a size, among at least two storage facilities, each of the storage facilities having a finite available capacity, the method comprising:

determining a probability of using a resource by a composite user;

~~{a)}~~ determining, for each resource, a change in value of storing the resource on a first storage facility versus storing the resource on a second storage facility;

~~{b)}~~ determining, for each resource, a change in cost of storing the resource on the first storage facility versus storing the resource on the second storage facility;

~~{c)}~~ determining, for each resource, a value density based on the change in value determined in act (a) and the change in cost determined in act (b); and

~~{d)}~~ ~~[proactively]~~ maximizing a total value density given a total size of resources being less than the finite available capacity of the first storage facility.

33. (Original) The method of claim 32 wherein the value of storing a resource on the first storage facility is a function of a perceived utility of such storage, per request for the resource, and a frequency of requests for the resource.

34. (Original) The method of claim 33 wherein the perceived utility of such storage, per request for the resource, is a function of a request-to-receive time delay.

35. (Original) The method of claim 34 wherein the request-to-receive time delay is a function of at least one of (i) a storage device read access time, (ii) a network speed, (iii) a network latency, and (iv) the size of the resource.

36. (Original) The method of claim 35 wherein the network speed is a function of a user configuration.

09/820,519

MS91212.01/MSFTP291US

37. (Original) The method of claim 33 wherein the frequency of requests for the resource is a function of a user type class and a number of users belonging to the user type class.

38. (Original) The method of claim 32 wherein the cost of storing a resource on the first storage facility is a function of the resource size.

39. (Currently amended) An apparatus for distributing resources, each having a size, among at least two storage facilities, each of the storage facilities having a finite capacity and a request-to-receive latency, the apparatus comprising:

{a}} a storage device for storing at least one user-based factor, at least one resource-based factor, and at least one storage facility-based factor; [and]

{b}} means for minimizing total expected latencies to request and receive resources, and

means for intelligently downloading resources.

40. (Currently amended) A storage medium having machine executable instructions which, when executed by a machine, effect acts of:

{a}} accepting at least one user-based factor;

{b}} accepting at least one resource-based factor;

{c}} accepting at least one storage facility-based factor; [and]

accepting probabilistic relationships between the at least one-user based factor and the at least one resource based factor; and

{d}} minimizing total expected latencies to request and receive resources.

41. (Cancelled)

42. (Currently amended) The method of claim [41] ~~40 [wherein the units of value and cost are the same, and wherein it is determined to effect the change when the difference between value and cost is positive]~~ further comprising changing a storage capacity of the storage medium based on at least one of a change in value and cost.

09/820,519

MS91212.01/MSFTP291US

43. (Currently amended) The method of claim ~~[41]~~ 42 further comprising changing the storage capacity ~~[wherein it is determined to effect the change]~~ when a ratio of value to cost is greater than one.

44. (Currently amended) The method of claim ~~[1]~~ 43 wherein the at least one user-based factor is a function of a time offline until the intermediate storage facility is reconnected with ~~[the]~~ a source.

45. (Original) The method of claim 44 wherein the time offline is a probability distribution considering at least one of (i) resource context, (ii) a user type class, and (iii) a recent usage pattern.
